Abstract (en)  
[origin: WO2006095090A1] The invention relates to a floating board or bodyboard with two lateral edges (4). The front edge (2) has a central region and two oblique lateral regions which are concave, convex or straight, and form two gripping regions (6). Two hollow regions are formed in the thickness of the upper surface of the board (1), said hollow regions being arranged towards the rear of the inner part (6a) of the gripping regions (6) and forming supporting regions (8) for forearms. Two regions (9) which are raised in relation to the supporting region (8) and the upper surface (1a) are formed in the thickness of the upper surface of the front part (7) of the board (1), said raised regions extending the external parts (6b) of the two gripping regions (6) along the two lateral edges (4) towards the rear. Preferably, the bottom of each supporting region (8) has a regular incline towards the front, from the rear part (11) to the corresponding gripping region (6).
