Abstract (en)
[origin: EP1705293A1] The method involves determining a soil reaction force and a phase angle as the compaction values, where the phase angle is an angle between the reaction force and a maximum frequency value of a frequency response system. Position coordinates of the land regions are combined with region specific actual compaction values to adjust the compaction values for eventual successive compaction process by an adjusting unit (41). An independent claim is also included for an arrangement of equipments including a device for compacting a land region.
