Abstract (en)

[origin: US2008227332A1] The invention relates to a plug connector (100) with a housing (110) and with at least two electrical contact elements (112), which each have a longitudinal axis and which are arranged so that they are aligned on a plugging side of the housing (110) at predetermined positions and with a respective longitudinal axis parallel to a plugging direction (122) of the plug connector (100). Each electrical contact element (112) is placed inside the housing (100) in a manner that enables it to move in a plane perpendicular to the plugging direction (122), and is connected in an elastically resilient manner to at least one second electrical contact element (112) via at least one electrically non-conductive elastic spring element (114). The elastic spring element (114) is arranged and designed so that the electrical contact elements (112) are pre-positioned at the respective pre-positioned position up to tolerance allowances, and they can be displaced in an elastically resilient manner from this position in the plane perpendicular to the plugging direction (122).
