Abstract (en)

[origin: EP1862593A2] The method involves scanning the line building by a measuring vehicle with a gauge device, transferring data memory captured by the gauge device to a central data memory device and determining the geographical position of the gauge device along the line building. The data with a reference data, which are in a reference database are determined with the gauge device before geological layer compositions and put down by a digital data processing. The determined geological layer compositions are compared and then assigned. An independent claim is also included for a condition detecting device for line construction.
