Abstract (en)

[origin: WO2006103262A1] Digital right management systems are technically constructed for protecting and carrying out wishes of a copyright holder such that the digital content is connected in a cryptographic and unique manner to any particular device and/or data carrier. Use of the digital content on other devices of the person who acquires rights is only possible after previous registration by the copyright holder. The aim of the invention is to produce a method, wherein the person who acquires rights can manage the acquired rights thereof themselves on the electronic data object without instructing the intervention of a central copyright holder. Said aim is achieved by virtue of the fact that the person who acquires the rights creates partial amounts of the user rights having individual user rights. The digital content can be used, respectively, in the periphery of the created partial amounts of the individual user rights.
