Abstract (en)

[origin: DE102005015466A1] The method involves examining validity of recording of heart muscle activities in real time in combination with a telemetric data communication. A measuring device is miniaturized or ergonomically arranged such that a tested animal remains unaffected in its perception, course of motion and natural surrounding field, despite of additional telemetric controls, where telemetric transmission of measuring signals uses a Bluetooth-standard. An independent claim is also included for a device for recording of muscle activities in animals.
