Abstract (en)

[origin: WO2006105335A2] Described are techniques and mechanisms for media data storage management. Briefly stated, a media control component monitors the usage patterns of media files on a local device. Any media files whose usage pattern falls below a given threshold is identified as a trim candidate. The media control component trims those trim candidates by eliminating data (content) from the media files. The data is eliminated from the latter portion of the media file so that the trimmed media file will continue to render properly when initially launched. If the trimmed media file is launched, the media control component retrieves the eliminated data from a content server on which is stored a library of media files.
