Abstract (en)

[origin: WO2006106262A2] The invention concerns a method for authenticating a user provided with an access right to a digital content using a terminal equipment (8). Said method includes: a configuration phase which consists in attributing to the user, through a trusted third party, an exclusive reference, independent of the terminal equipment and previously correlated with an identifier of the user; a phase of associating said identifier with a condition of access to said content; a controlling phase locally performed at the terminal equipment, which consists in verifying a predefined relationship between an information supplied by the user and the reference attributed to the user and designated by the identifier; and a phase of decision locally taken in the terminal equipment which consists in authorizing or prohibiting access to the content based on the result of said verification.
