Abstract (en)

[origin: EP1867368A2] The skate assembly has a bogie frame (5) including a brake pad (17), a pad support (19) and a wear compensation system. Such a system includes an articulation, enabling the pad support (19) to be lifted relative to the rest of the frame (5), and a movable locking lever (21). During braking, the lever (21) is fastened into the slots (23) provided for fastening the lever (21). When the pad (17) has worn out, the user can unlock the lever (21) and rotate the support (19) so as to bring again the pad close to the ground (T). In this way, notwithstanding the wear of the pad (17), the need for excessively tilting the skate for braking is avoided. The adjustment system is very simple from the manufacturing standpoint, and is easy and quick to lock.
