Abstract (en)

[origin: DE102006027547B3] The bridge is assembled of carrying elements (3) and steel sleepers (4) transversally positioned on top of the elements (3). The joint area between them comprises several vertically positioned metal elements (7) and transversally positioned cross brackets (10). The sleepers (4) are either screwed to one of the angles (9) at the bridge or joined with clamping elements if no angles (9) are available. Each of the cross brackets (10) is prepared with exactly positioned bores. Only the metal elements (7) have to be processed at the final destination in order to be screwed to the brackets (10). An independent claim is given for a holding system to be added to the bridge.
