Abstract (en)

[origin: WO2006108944A2] The inventive device for storing bottles with a neck comprises a hooking unit (14) for suspending said device under a domestic refrigerator shell (4) and a hollow delivery guide (11) longitudinally extending away from a rear end (12) to a front end (13) which is provided with a delivery opening (16). Said delivery guide consists of a top surface (11a) provided with the hooking unit (14), a lower surface (11b) and a C-shaped cross section with an opening towards the lower surface. The width of the opening is embodied in such a way that a constricted part of the neck (8) of a bottle (7) is enabled to freely slide and the inwardly oriented longitudinal rims of the opening form supporting rails (17, 18) whose length is greater than double the diameter of the bottle neck enlarged section and by which said enlarged part is supported when the bottle is suspended.
