Abstract (en)

[origin: WO2006102697A1] A fluid flow test device comprising: a chromatography path of aqueous wicking material (100) on which is deposited at an upstream site at a selected delivery time an aqueous biological sample (190) to be tested for the presence or absence of a target material; a capture material bound to the wicking material at a test site (T) downstream of the upstream site, the capture material having a functionality that binds to a first locus on the target material upon wicking of the target material downstream to the test site; a visual label material having a functionality that binds to a second locus on the target material, the chromatography path having a site (170) upstream of the test site at which the visual label material is begun to wick at a predetermined point in time after the first delivery time such that the visual label material does not intermix with the aqueous biological sample within the chromatography path.
