Abstract (en)

[origin: US2009215374A1] A device for intermediate storage, collection and dispensing of coins contains at least one magazine for controlled reception, intermediate storage and controlled return of the coins and also an overflow for dispensing coins when the magazine is filled into a collection container. Furthermore, an additional storage space is provided for controlled reception of coins inserted during an insertion process, alternatively to reception in the magazine, and for controlled dispensing of the received coins of the one insertion process either to a return device or into the collection container. Preferably the coins are conducted, during disturbance-free operation, into the magazine and, upon a disruption in the magazine, into the storage space.
