Abstract (en)
[origin: WO2006105997A1] The invention relates to an intermediate cash box comprising a flap assembly that is pivotally mounted in a housing, said assembly forming a receptacle for coins in its resting position. According to the invention, when the flap assembly is pivoted in a controlled manner, this releases the coins into a return channel or a cash box. The flap assembly comprises two V-shaped flaps, each flap being assigned to a pivotally mounted gate lever with a slide-gate track that guides the displacement of the flap. A rotatably mounted displacement transfer element, which is driven by a drive, is in contact with the gate levers and transfers the displacement of the drive to one of the respective gate levers in order to pivot the latter.
