Abstract (en)
[origin: EP1870541A1] The device has a fixation clip (34), whose ring (36) is provided with two diametrically opposite tabs released by two free half-ends. The free half-ends have two lateral half-edges (54, 56) that extend outwards from a longitudinal slot (22), and another set of two lateral half-edges (58, 60) supported against a bottom (28) of the slot. The lateral half-edges (58, 60) are relative to two opposite lateral walls (24, 26) of the slot to block the tabs in the slot and form a blocking unit for blocking rotation of the fixation clip around a lock stator (10).
