Abstract (en)

[origin: EP1870897A2] A method and apparatus for setting a playlist for content files stored in a mobile terminal that can reduce initial execution time associated with the content files by generating the playlist using header information extracted from the content files are provided. A specific content file is stored in a first memory unit and header information is extracted from the stored content file. A playlist is generated using the header information and the playlist is stored in a second memory unit. The playlist stored in the second memory unit is read when a command to execute the content file is received and the content file is executed. The method facilitates the execution of a content file without having to read header information and thus reduces the initial execution time associated therewith by generating the playlist using the header information for a packet in the content file before execution.
