Abstract (en)

[origin: WO2006106405A1] A method of authenticating a user of a network terminal device includes linking an identification of a communications device to a client account with a financial institution. A request is then received to conduct a transaction on a client account and a password is generated. The password is transmitted to the communications device linked to the client account. The client enters this password into the network terminal device and the entered password is received from the network terminal device. If the entered password matches the password transmitted to the communications device then the user of the network terminal device is authenticated.
