Abstract (en)  
The invention relates to a shelving having a group of rectangular shelves (1) supported by intermediate bars. Each intermediate bar is divided into a group of sections (5) with a length equal to the gap between the shelves (1), attached to one another by a threaded rod (7), through a plurality of through holes (3) made in each shelf (1). A support (9) is located under the lower shelf (1) to stabilize the shelving. Each shelf (1) is formed from a profile that has two horizontal walls joined by partition walls, a horizontal groove (4) in a longitudinal edge and a slot (2) in each larger surface, which can be used to assemble sliding doors. The upper shelf (1) is fixed to a support wall through two brackets (10) which carry out leveling functions so as to correct the uneven ground.
