Abstract (en)

[origin: EP1872904A1] The device has a machining station with machining tools (12, 13) that machines lower and upper faces (7, 8) of a construction element (1). The machining tool (12) e.g. bell tool, is disposed at a level of a lower bearing surface and rotated around a rotational axis (A) perpendicular to the lower bearing surface. The machining tool (12) has a machined surface of appreciably annular form. A circular shaped fixed table (15) supports the lower face and is disposed at a center of the machining tool (12). Additional bearing surfaces are provided perpendicular to upper and lower bearing surfaces.
