Abstract (en)

A locking assembly for a ventilating window that has a sash arranged to be openable with respect to a main frame by pivotal movement about an axis that is parallel to a pair of opposed sash members. The locking assembly comprises a strike plate (6) fixed to a main frame member (1) opposite one of said pair of sash members (2) and a casing (102) fixed to said one sash member (2) opposite the strike plate (6). A locking mechanism that is arranged in said casing (102) is operable by an operator member (4) that can be accesses from the inside of the window. The operation of the locking mechanism is done via at least one actuator slide (13) that is displaceable in guide means (14) in the casing between a first end position defining the unlocked position and a second end position defining the locking position. The locking mechanism has shielding means (103) that are fixed in relation to the casing (102) and at least a part of said shielding means (103) is arranged between the actuator slide (13) and the outside of the window.
