Abstract (en)
[origin: EP1876622A1] The switch has a follower (1), where the follower is movable over a rotary locking element (3) by an actuator (2), from a rest position into an operating position. Another rotary locking element (5) blocks the former rotary check element by the follower. The follower is provided in operating position for accumulation of an effective area of the former locking element and in rest position for accumulation of an effective area of the latter locking element.
