Abstract (en)
[origin: WO2006114555A1] The invention relates to a device for the suspension of slats for a bed, consisting of an end piece having an upper section (12) comprising at least one housing for receiving the end piece of a slat, a lower section (18) provided with means for anchoring (20) the end piece to a frame for the slats, and an intermediate section (22) comprising suspension elements connecting the lower section (18) to the upper section (12), the intermediate section (22) essentially consisting of a first flexible-type material and the lower section (18) consisting of a second rigid-type material. The invention is characterised in that the intermediate section (22) and the lower section (18) are produced as a single component by moulding.
