Abstract (en)
[origin: WO2006119929A2] The invention relates to a device for separating a plastic clay column (2) into slugs (2a), said column being displaced along a conveyor passage (3). The device comprises at least one notching device (1) for notching the clay column (2) and a cutting device for cutting the clay column (2) in the notches, said notching device having notching strips (4) on all sides of the conveyor passage (3). In order to improve the notching device (1), all notching strips (4) are received independently of each other and can be displaced from a release position into a notch position and back which is offset from the center axis (3a) of the conveyor passage (3).
[origin: WO2006119929A2] The device for separating a plastic clay column (2) into slugs (2a), the column is moved along a conveyor passage (3). The device has a notching device (1) for notching the clay column and a cutting device for cutting the clay column in the notches. The notching device has notching strips (4) on all sides of the conveyor passage. All notching strips are received independently of each other and can be moved from a release position into a notch position and back which is offset from the center axis (3a) of the conveyor passage.
