Abstract (en)

[origin: WO2006105622A1] The invention concerns supports or receptacles for solubilized or suspended biological entities whereof the walls are made of plastics surface-treated by an electromagnetic plasma followed by a polymer deposition. It can be in the form of tubes or multiple-well plates. It provides among other things the possibility of storing, transferring and performing reactions in the context of microassays of biological entities, more particularly the prion protein, with enhanced sensitivity.
