Abstract (en)

[origin: WO2006114075A1] The invention relates to an arrangement for actuating a clutch of a vehicle, wherein a movement of the clutch pedal is transmitted by means of a cinematic system to a clutch operator. The clutch pedal (I) is coupled via the cinematic system to at least one energy accumulator by means of a contact element which can be displaced along a predetermined contour range (5,5') and which is used to adapt the pedal force characteristic line. According to the invention, the contour line can be predefined at least partially by shaping the spring element which is used as an energy accumulator. The invention also relates to an arrangement for actuating the clutch of a vehicle, which comprises a leaf spring which is used as an energy accumulator, whereon the contact element is fixed, and a contour area which is provided on a curve disk and which is rigidly connected to the clutch pedal.
