Abstract (en)

[origin: US2006248097A1] This invention relates to a method for creating an application that corresponds to a set of components, whose execution provides a tailored result according to the usage conditions of the application. The method includes the generation of a set of DOM-type XML documents that include the non-generic logic of the application; the generic logic is associated to Java classes related to certain elements in the DOM. The method according to the invention allows users, in a completely original manner, to easily modify the application without having to recompile all the executables.
