Abstract (en)

Using a method and apparatus for fabricating an elongate foundation element of the type comprising a floor plate (1) with a first cross sectional width and a rib (2) with a second smaller cross sectional width positioned on top of the floor plate, the floor plate is cast from concrete within an appropriately shaped first mould (4) with a substantially open top, and the rib is cast from concrete on top of the floor plate within an appropriately shaped second mould (6) with a substantially open bottom and substantially open top when the concrete floor plate has hardened to such a degree that its concrete does not flow anymore. A nose (3) with an even smaller third cross sectional width may be provided on top of the rib in a corresponding manner.
