Abstract (en)
[origin: US2010132740A1] Particularly in hospitals, care homes or similar institutions, it is necessary to have a safely handled and reliable method for the emptying and cleaning of excretion containers, for example urine bottles or bedpans. A method and a system (110) are therefore proposed, by means of which such articles to be rinsed (112) can be treated. In this case, first, in an emptying step (210), the articles to be rinsed (112) are emptied and are rinsed out with a rinsing-out liquid. Subsequently, in a circulation step (212), the articles to be rinsed (112) are washed in circulation. Finally, a rinsing-clear step (214) is carried out, in which the articles to be rinsed (112) are rinsed with a rinsing-clear liquid. Then, in an optional disinfection step (216), preferably a chemical disinfection step (216), the articles to be rinsed (112) are disinfected, and, in an optional drying step (218), the articles to be rinsed (112) are dried by being blown off with heated air.
