Abstract (en)

[origin: WO2006119969A1] The invention describes an apparatus for maintaining the temperature of refrigerated food in a food container which is in the form of a meal transporting cart, for example. A refrigerating module (6) which can be charged with a coolant is provided in the food container. In order to achieve the most uniform distribution of cold in the food container possible, the invention proposes connecting the refrigerating module (6) to cavities in the partition walls (4, 5) or outer walls of the food container. The coolant can flow into the food container via openings in the partition walls or outer walls and uniformly cool said food container.
