Abstract (en)

[origin: DE102006015684B3] The actuator has an operating ring (18) rotatable around an axis of rotation (7) and arranged on a tube-like receiving cylinder (6). The operating ring and/or the receiving cylinder are movable from a neutral position to a switching position against a spring force. A rotary encoder ring is arranged coaxially adjacent to a rotary encoder, which is fixedly connected with the cylinder, so that the relative rotating position of the rotary ring to the rotary encoder is detectable. A touch sensitive input and/or display area (14) of the cylinder is rotatably supported around the axis of rotation.
