Abstract (en)

Provided are a sheet material accumulating method and a sheet material accumulating apparatus capable of performing a proper accumulation of a sheet material that does not produce a defective in the next process even when an overlap condition of a conveyed sheet material, such as a printed sheet, varies. Provided is a sheet material accumulating method for accumulating the sheet material (W) continuously conveyed from the above while a part of the sheet material (W) is overlapped, with the sheet material standing on a lower horizontal table (7), including the steps of detecting a backpressure (F) that a bundle of sheet materials applied to a holders (8) for preventing a head side collapse of a bundle of sheet materials accumulated on the table during an accumulation process; and controlling a movement of the holder in an accumulation direction so that a backpressure may maintain a predetermined magnitude.
