Abstract (en)

An event processing apparatus and method for a mobile communication terminal are disclosed. The event processing apparatus includes a security level determiner for identifying, in response to reception of an event, a security level of the received event using registered security settings for individual persons; a security level comparator for comparing the identified security level of the event with a current security level of the mobile communication terminal; a controller for controlling, if the security level of the event is greater than the security level of the mobile communication terminal, a display operation not to display the event; and a display unit for displaying event information under the control of the controller. Thereby the user can easily protect stored private information from leakage or exposure to other parties, by changing security levels of the mobile communication terminal with respect to security levels of events.
