Abstract (en)

The present invention concerns a connector (1) able to be mounted on the neck of a container for liquids (100), in the form of a bottle, consisting of a main body having, sliding longitudinally therein, a slider provided with a radially expandable bottom portion so as to engage reversibly with a hollow probe, in which the hollow probe is able to perform the longitudinal displacement of the said slider and connect the inside of the container (100) with its interior so as to allow the dispensing of liquid from the container.
