Abstract (en)
[origin: EP1884611A2] The lock has an adjustable locking lever (4) that is attached in a locking position and in an unlocking position. The lever present in the locking position locks a lift of a pawl (2). An actuating mechanism adjusts the lever during a manual actuating process in a release position. The mechanism has a closure nut that is pivoted around an axis. The nut is connected to a closing cylinder, and is adjusted for a manual actuating process. An actuating lever (12) engages with the pawl, where a lever is coupled with the pawl. The release position is made by lifting the pawl with the process.
