Abstract (en)  
[origin: EP1884732A2] The exchanger has a heat wheel comprising foil layers lying one upon the other, and fluid channels (9, 10) formed between the foil layers. The fluid channels formed by uprisings and/or recesses of opposite surfaces of the adjacent foil layers are cut from one another. The uprisings and/or recesses of the layers run parallel to one another like a wave around an axial direction (11) of the wheel. The foil layers are made from metallic material such as aluminum.
