Abstract (en)
[origin: US2006269169A1] A closure has at least one channel portion adapted to receive an interlocking profile portion. The channel has at least one window permitting visual inspection of a profile interlocked therein. At least one profile is disposed for interlocking with the channel and includes a stem joined to the closure and one or more latching projections formed by a frangible connection to the stem, wherein one or more projections are adapted to cooperatively interlock with the channel portion of the closure, thereby sealing the closure. In one closure, a tamper evident structure is included in the form of a slider having a shaver to engage in shaving contact with interlocking closure members when passed along the closure in a direction opposite to the closing direction. The various closure members can include different colors. The closures can be used on bag structures.
