Abstract (en)
[origin: WO2006128436A1] The invention relates to an articulated and/or bearing arrangement (1; 101; 201; 301; 401) which comprises an articulated or bearing body which comprises an articulated pin (2; 102; 202; 302; 402) which can be rigidly maintained in a receiving opening (6), for example, in an in-pressing opening of a transversal link (7), and at least one section (8) which protrudes in the direction of the end of the pin (9) in order to, at least regionally, support the annular body (10; 10a; 110; 210; 310), in particular a cone disk, whereon a parallel-walled or slightly protruding area (11) connects in relation to the end of the pin (9). Said arrangement is embodied in such a manner that the transition (14) between the protruding section, which is supported on the annular body (10; 10a; 110; 210; 310), and the slightly protruding or cylindrical section (11) in relation to the end of the pin (9), is arranged on the outside of the axial extension of the annular body (10; 10a; 110; 210; 310).
