Abstract (en)

[origin: WO2006129937A1] Provided are a method and apparatus for setting the time of a real-time clock included in a digital broadcast receiver. Since the digital broadcast receiver sets the time of the real-time clock included therein, based on time information contained in a received transport stream, it is possible to synchronize the time of the real-time clock with a reference time based on the time information contained in broadcast data transmitted by a broadcast transmitter. Accordingly, it is possible to minimize time-related errors during the execution of a time-dependent application program such as a scheduled-recording program.
