Abstract (en)
[origin: WO2006129177A1] A support (120) for a bicycle (B) having a front wheel (W+) and a rear wheel (W2) includes a frame (122) and a trough-shaped support (140) including a pivoting wheel engagement section (143) pivotably mounted to the frame in a first location for movement about a pivot axis between a loading position and a support position. The pivoting wheel engagement section engages a portion of an outer periphery defined by a first one of the bicycle wheels (W1, W2) , and faces upwardly to receive the bicycle wheel when the wheel engagement section is in the loading position and faces laterally when the wheel engagement section is in the support position. A second wheel engagement member (142) is mounted to the support frame (122) in a second location spaced from the first location, and is configured to engage a second bicycle wheel (W2) when the wheel engagement section is engaged with the first bicycle wheel (W1) in the support position.
