Abstract (en)

[origin: WO2006131169A1] The invention relates to a container, in particular a plastic ampule which is produced using a blow-moulding process and is filled and closed in the mould, having a neck part (12) which adjoins a container body (10) and onto which a first cap part (14) can be screwed, and having a second cap part (16) which extends at least partly between the first cap part (14) and the neck part (12) and which is provided with an opening device (20), which has at least one opening (22), for opening the container body (10), which opening device can be closed by means of the first cap part (14), with the first cap part (14) carrying along the second cap part (16) by means of the screwing-on process of the said first cap part in such a way that the opening device (20) causes the container body (10) to be opened, with a closure part (closure pin 26) of the first cap part (14) unblocking the opening (22) in the opening device (20) after the said first cap part is unscrewed, and with the second cap part (16) remaining on the neck part (12).
