Abstract (en)

[origin: EP1889991A2] The closure has a base provided with a locking structure, and a lever (11) deviated against the base and locked with the locking structure. The lever is connected with a rotating bar at an end in a torque-proof manner. A metal plate is formed for the lever, where the metal plate has a shell structure. The shell structure has an outer wall for defining an outer side of the lever and side walls (23A, 23B) bend from the outer wall in a direction of the base. An inner wall (32) is arranged in a plane parallel to the outer side and extended between the side walls.
