Abstract (en)

[origin: EP1890203A1] The case (1) has a middle (2) comprising a threaded portion (16) along a direction that is opposite to a threading direction of the bottom (6). An intermediate ring (8) has threaded portions (18, 20) that respectively cooperate with a threaded portion (14, 16) of the bottom and the middle. The portion (18) is provided in a wall delimiting an opening (22). An elastic ring (30) or an elastic sleeve is placed between the ring and the bottom, and increases frictional torque between the ring and the bottom. An independent claim is also included for a method for orienting a bottom of a watch case on a middle.
