Abstract (en)
[origin: WO2006076769A1] A leash clip (1) comprises a body (2) having a hole O therethrough. The body further comprises a lateral opening into the hole. An element (10) is pivotally mounted to the body, with the element being adapted such that, when in a first position, it closes the lateral opening into the hole and also interacts with the body whereby its pivoting with respect to the body is restricted. The element is displaceable to a second position (25) in which it can pivot with respect to the body to open the lateral opening. Alternatively, the element may have its pivoting with respect to the body restricted by a locking member (32) pivotally mounted to the body. In a locking position the locking member interacts with the element (10) in the first position to restrict its pivoting. However, the locking member is pivotable from the locking position to an unlocked position whereby the element is freed to pivot with respect to the body to open the lateral opening.
