Abstract (en)
[origin: WO2006084605A1] The invention relates to a device comprising a first fixing part (1) which comes into contact with an object and a second fixing part (10) which can be connected to a carrier. The first fixing part (1) is provided with a receiving sleeve (4) which receives a shaft section of the second fixing part (10) in a shaft receiving region (5). The receiving sleeve (4) is embodied with an insertion opening (6). The second fixing part (10) comprises a head (11) which is provided with a securing structure (14, 15). At least two complementary structures (16, 17) co-operating with the securing structure (14, 15) are provided in the shaft receiving region (5), said complementary structures being at a distance from each other in the longitudinal direction and respectively securing the head (11) against rotation. A shaft fixing arrangement, comprising at least one shaft fixing element (9) at least between the free end of the receiving sleeve (4) opposing the first fixing part (1) and the complementary structure (16, 17) adjacent to the free end, is used to fix the shaft section in the shaft receiving region (5). In this way, different working lengths can be adjusted.
