Abstract (en)
[origin: US2006283960A1] Methods and systems for enabling contactless communications with a contactless card are disclosed. A contactless card may include a contactless interface activation mechanism that includes one or more sense contacts, a processor, and a processor-readable storage medium in communication with the processor. The processor-readable storage medium may contain programming instructions for performing one or more applications. The processor may be in a protected state in which the processor is prevented from performing the instructions for at least one application in the processor-readable storage medium unless a load is placed on at least one sense contact.
