Abstract (en)

[origin: WO2006134108A1] The invention relates to a method for producing an electrical connection point by means of an electric, in particular, multiwire conductor (7) provided with an insulating sheath (8) and a metal housing (2) positioned, for example, on a cable lug, wherein said electric conductor (7) is partially uncovered in said metal housing (2) which is connected to the electric conductor (7) by a solid pressure shaping. The connection between the electric conductor (7) and the metal housing (2) and said metal housing (2) which is positioned, for example on a cable lug, are also disclosed. The aim of said invention is to prevent a liquid capillary transport and to produce a connection and a housing (2) provided with a simply designed seal. For this purpose, prior to the solid pressure shaping, the metal housing (2) is filled with a sealing agent (11) in the form of a gel-like liquid and the pressure shaping is consequently carried out.
