Abstract (en)

[origin: EP1892361A1] The window/door has a frame (2) for anchoring in opening of a building. A casement (4) is received in the frame and tilted about a tilt axis (20) into a final tilting position. A locking element (16) is securely connected to the frame and provided with an engagement area (18) that fittingly engages a depression in the casement, when the casement is tilted to the final tilting position. A security scissor hinge connects the frame, where the scissor hinge is arranged on a side of the casement in opposition to the tilt axis.
