Abstract (en)

[origin: WO2006131328A1] The invention relates to a system for the oral administration of a solid to persons suffering from dementia, comprising at least two devices, each of said devices having an optionally transparent hollow body (1) with a liquid inlet end (2) and a liquid outlet end. A solid (4) and a liquid-permeable, optionally displaceable, retaining element (5) are disposed inside the hollow body, so that said retaining element (5) prevents the solid (4) from escaping the inside of the hollow body (1) via the liquid inlet end (2).
