Abstract (en)

[origin: EP1894638A1] A physical dimension is detected so as to determine a proportion for an amount of water carried through a high-pressure pipeline (HPP) in one or more pumping processes within a preset interval of time (delta T0). The HPP is scoured at the next point in time set in advance according to a plan. An independent claim is also included for a device for carrying sewage/waste water with a sewage/waste water collecting shaft, a pump for carrying sewage/waste water out of this shaft, a scouring device for scouring a high-pressure pipeline linked to the pump and a control device for switching the scouring device on and off.
