Abstract (en)

[origin: EP1894673A1] The method involves acquiring an optical reference frame of a lens (100) by a turntable (2) and fixing a locking accessory (201) in the frame during centering of the lens. The lens is trimmed according to a contour in the frame and mounting parameters. The accessory has a radio frequency identification element (220) carrying an identification code. The code is read according to a reading during the centering of the lens for associating the parameters into a memory. The code is read according to another reading during trimming of the lens for recovering the parameters associated to the code.
